Injury Prevention & Rehabilitation in the Adolescent Athlete

3 Take-homes

- 1. Understand the SSP Injury prevention philosophy
- 2. Understand why/how youth athletes get injured
- 3. Understand the system of rehabilitation in the SSP

Perseverance

Every athlete will get injured in their career

The Dan Menzel Story

SSP Injury Prevention Philosophy

Why Do Injuries Occur?

Maturation Load Gender Poor Movement Injury History Poor Strength & Conditioning Imbalances Genetics Sometimes.. Just unlucky

Maturation

How do we mitigate against injuries?

Load Management & Development Movement Skills Strength & Conditioning Imbalances – Individualisation The better I get the luckier I am

The Rehab Process

- 1. Report to athletic development coach
- 2. Book physio assessment (Mon/Wed/Fri)
- 3. Individual plan
- 4. AD coach to manage within SSP
- 5. RTP is progressed as a team (physio/AD/coaches)

Injury Management In Adolescents Michael Snelling

Common Adolescent Injuries

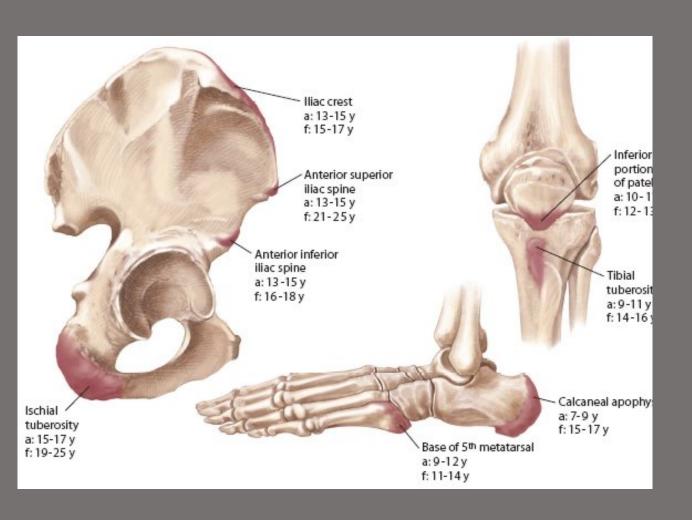

Apophyseal / Tendon interface injuries

Bone stress

- Chronic overload
- Acute fractures/dislocation

Apophyseal / Tendon Interface Injuries

Apophysis

= bony prominence for site of attachment of tendon or ligament

Common sites of apophyseal injuries

- Front of pelvis hip flexors (iliacus, rectus femoris, sartorius, TFL, pectineus, adductor longus)
- Bottom of pelvis hamstrings
- Bottom of kneecap patella tendon
- (Sinding-Larsen-Johannsen)
- Top of shin insertion of patella tendon
- (Osgood Sclatter's)
- Back of heel Achilles tendon
- (Sever's)
- Outside of midfoot peroneus brevis

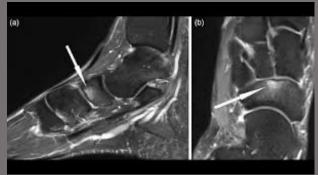

Bone Stress Injuries

Chronic overload

- Medial tibial stress syndrome ('shin splints')
- Metatarsal stress (long foot bones)
- Navicular stress fractures (midfoot)
- Lumbar spine (L4 or L5 pars interarticularis)

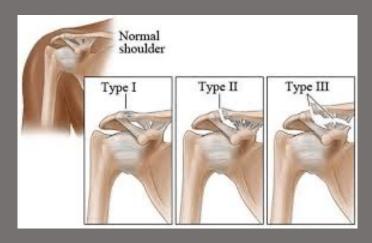

Bone Stress Injuries

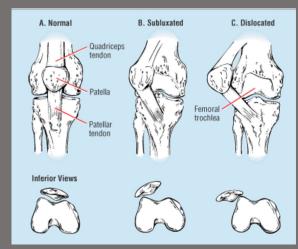

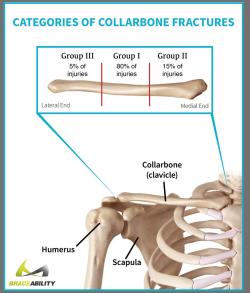

Acute fractures / dislocations

- Avulsion lateral malleolus (outside ankle)
- Patella dislocation common in girls
- Shoulder dislocation
 - AC joint
 - Glenohumeral (ball and socket) joint
- Finger dislocation

Management of Adolescent Injuries

Key factors:

- 1. MATURATION (chronological age v biological age)
- 2. LOADS

Always respect maturation but cannot influence maturation

Always *manage loads* for optimal performance

What happens with maturation:

- Increased androgen concentrations (changes in bone growth, muscle development and fat distribution)
- Fibre-type differentiation
- Muscle-tendon architectural changes

Assessment of Adolescent Injuries

- Accurate and detailed history
- Understand youth athletes experience with injury
- Always individualised
- Every teenager's body is going through considerable change
- Must consider volume, duration, intensity and type of training over the past year

Rehabilitation of Adolescent Injuries

Always consider modifying training loads rather than ruling out of activity

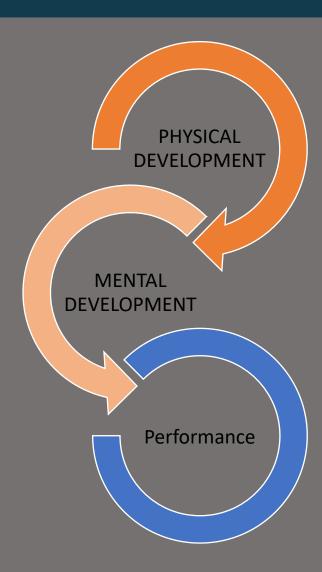

Concentrate on deficits found in assessment

- Commonly related to MOVEMENT CONTROL always correct movement patterns
- Adolescents can always work on strength, power and agility
 - Strength development is not just muscular, it is also related to neural and mechanical properties
 - Improved power can come from learning correct movement patterns and technical competency and neural plasticity (neural contribution to rate of force development).
 - Agility is related to technique, speed, leg length, body shape and perceptual and decision-making processes

Adolescent Injuries

Always consider
PHYSICAL & MENTAL
DEVELOPMENT over
performance

Management of Adolescent Injuries

Monitor physical growth and load

Respect a changing body

 Load = number of physical activity sessions completed per week (recommended to write down)

Adolescent Injuries

Promote children learning the benefits of athletic training (including rehab)

Develop an intrinsic motivation for training

Strong predictor of well being and associated with positive behaviours

Lifelong participation in an active lifestyle

Better health outcomes and quality of life

Role of the Coach Susan Meaney

Coaches Perspective & Role of Coach

- Athlete First & Wellbeing perspective (balance)
- Load Management information
- Promote open proactive communication and honesty
- Trust people and planning and follow the process
- Utilise the resources you have!!!!

habits of diet, sleep, hydration.

5 Take-homes for Athletes

- 1. Communication proactive, honest, positive mindset
- 2. Be diligent in rehab, remain engaged, follow what's asked
- 3. Be Kind to yourself, have balance in life.
- 4. Set return to training and play goals.
- 5. Do not underestimate value of rehab, prehab and good life habits of diet, sleep, hydration.

4 Take-homes for Parents

- 1. Communication proactive, honest, perspective!!
- 2. Encourage wellbeing first mindset vs sheep stations
- 3. Encourage student independence / self management
 - in this process (learning opportunities)
- 4. Trust the process and people involved.
