

# Thorny Devil

**Did you know that Thorny Devils can eat up to 3000 ants at a time? Thorny Devils are one of many kinds of Australian desert animals! Thorny Devils have an incredible amount of spikes to protect them! In this Report you will learn about Their Habitat, what they eat and How they protect themselves!**

**Thorny Devils live in the Australia deserts. The Thorny Devil is also located in the inward or the West of Australia. Thorny Devils are a rare species of animals because they are an endangered species. The Thorny Devils can only be found in the rare area of Australia's Deserts.**

**The Thorny devils have many adaptations, some of those are their spikes, to help to protect themselves from their predator. Their camouflage is very important because of its red and brown skin to camouflage into the environment to protect them from their predators and their spiky teeth to catch their prey. One of the thorny Devils most extraordinary adaptations is that they have false head chicken fuse predators.**
