

# Angles

An informative presentation made by Alina and  
Penny

# Right Angles

You can tell when you are seeing a right angle cause it looks like a corner of a square. These angles are always 90 degrees

# Acute angles

Acute angles aren't that easy to find. They are always  $< 90$  degrees.

# Obtuse Angle

An obtuse angle is an angle that is  $>90$ . I don't really have much else to say

# Straight angle

Straight angles are always flat and nothing more. They are exactly 180 degrees

# Reflex angles

These are angle of  $>180$  degrees. They are extremely hard to find in the real world

# Full rotation

This is an angle of exactly 360 degrees
